

Hello, I am lee kah han

I am alone and i rushed this very late

Game Story

The original game concept was a scientist who was experimenting with shrinking machines, but due to an accident, the scientist gets shrunk, the memories are fuzzy and must return to normal before getting caught. Context: there are annoying pests that look like small humans, so the scientist has to hide.

Aim of the game

To let people see things in a way they usually do not. e.g. pencils, tape, and cloth - seems like normal objects, but put them together and you get a glider.

Game Mechanics

It was a metroidvania-lite game, so it basically had abilities, or inventions(the experimental part) and back-tracking after getting the abilities. My teammates unfortunately were not able to reply me through discord, so I had to rush it on Thursday. To make up for that, I changed the idea to a top-down mostly just crafting game. You only have to take certain objects, craft, get more places to go then repeat. There was also supposed to be art but I could not finish

Why it would be fun/useful

It is not, since I am not fully finished, but I think that it can still be a little bit fun just to see how you can do things faster. It can be useful as you are basically forcing people to see things in a new way.

Design choices/implementations

So one choice was to just cut down most of the features I planned, as I really did not have the time to do it. I coded most of it myself, but when it came to giving feedback or debugging, I used chatgpt if I could not fix it myself.

Future Developments

I think I may just continue this as a personal project, I think it could do better in 3d as it is about real objects, and we live in a 3d space. I hope that I can finish it when I have the time to.
