

Game Jam 2026

U1 - Hong Jiang, Edmund, Brandon

Game Concept

- A piece of paper that can transform into different forms to pass through obstacles
- Different forms adds an additional layer of problem solving

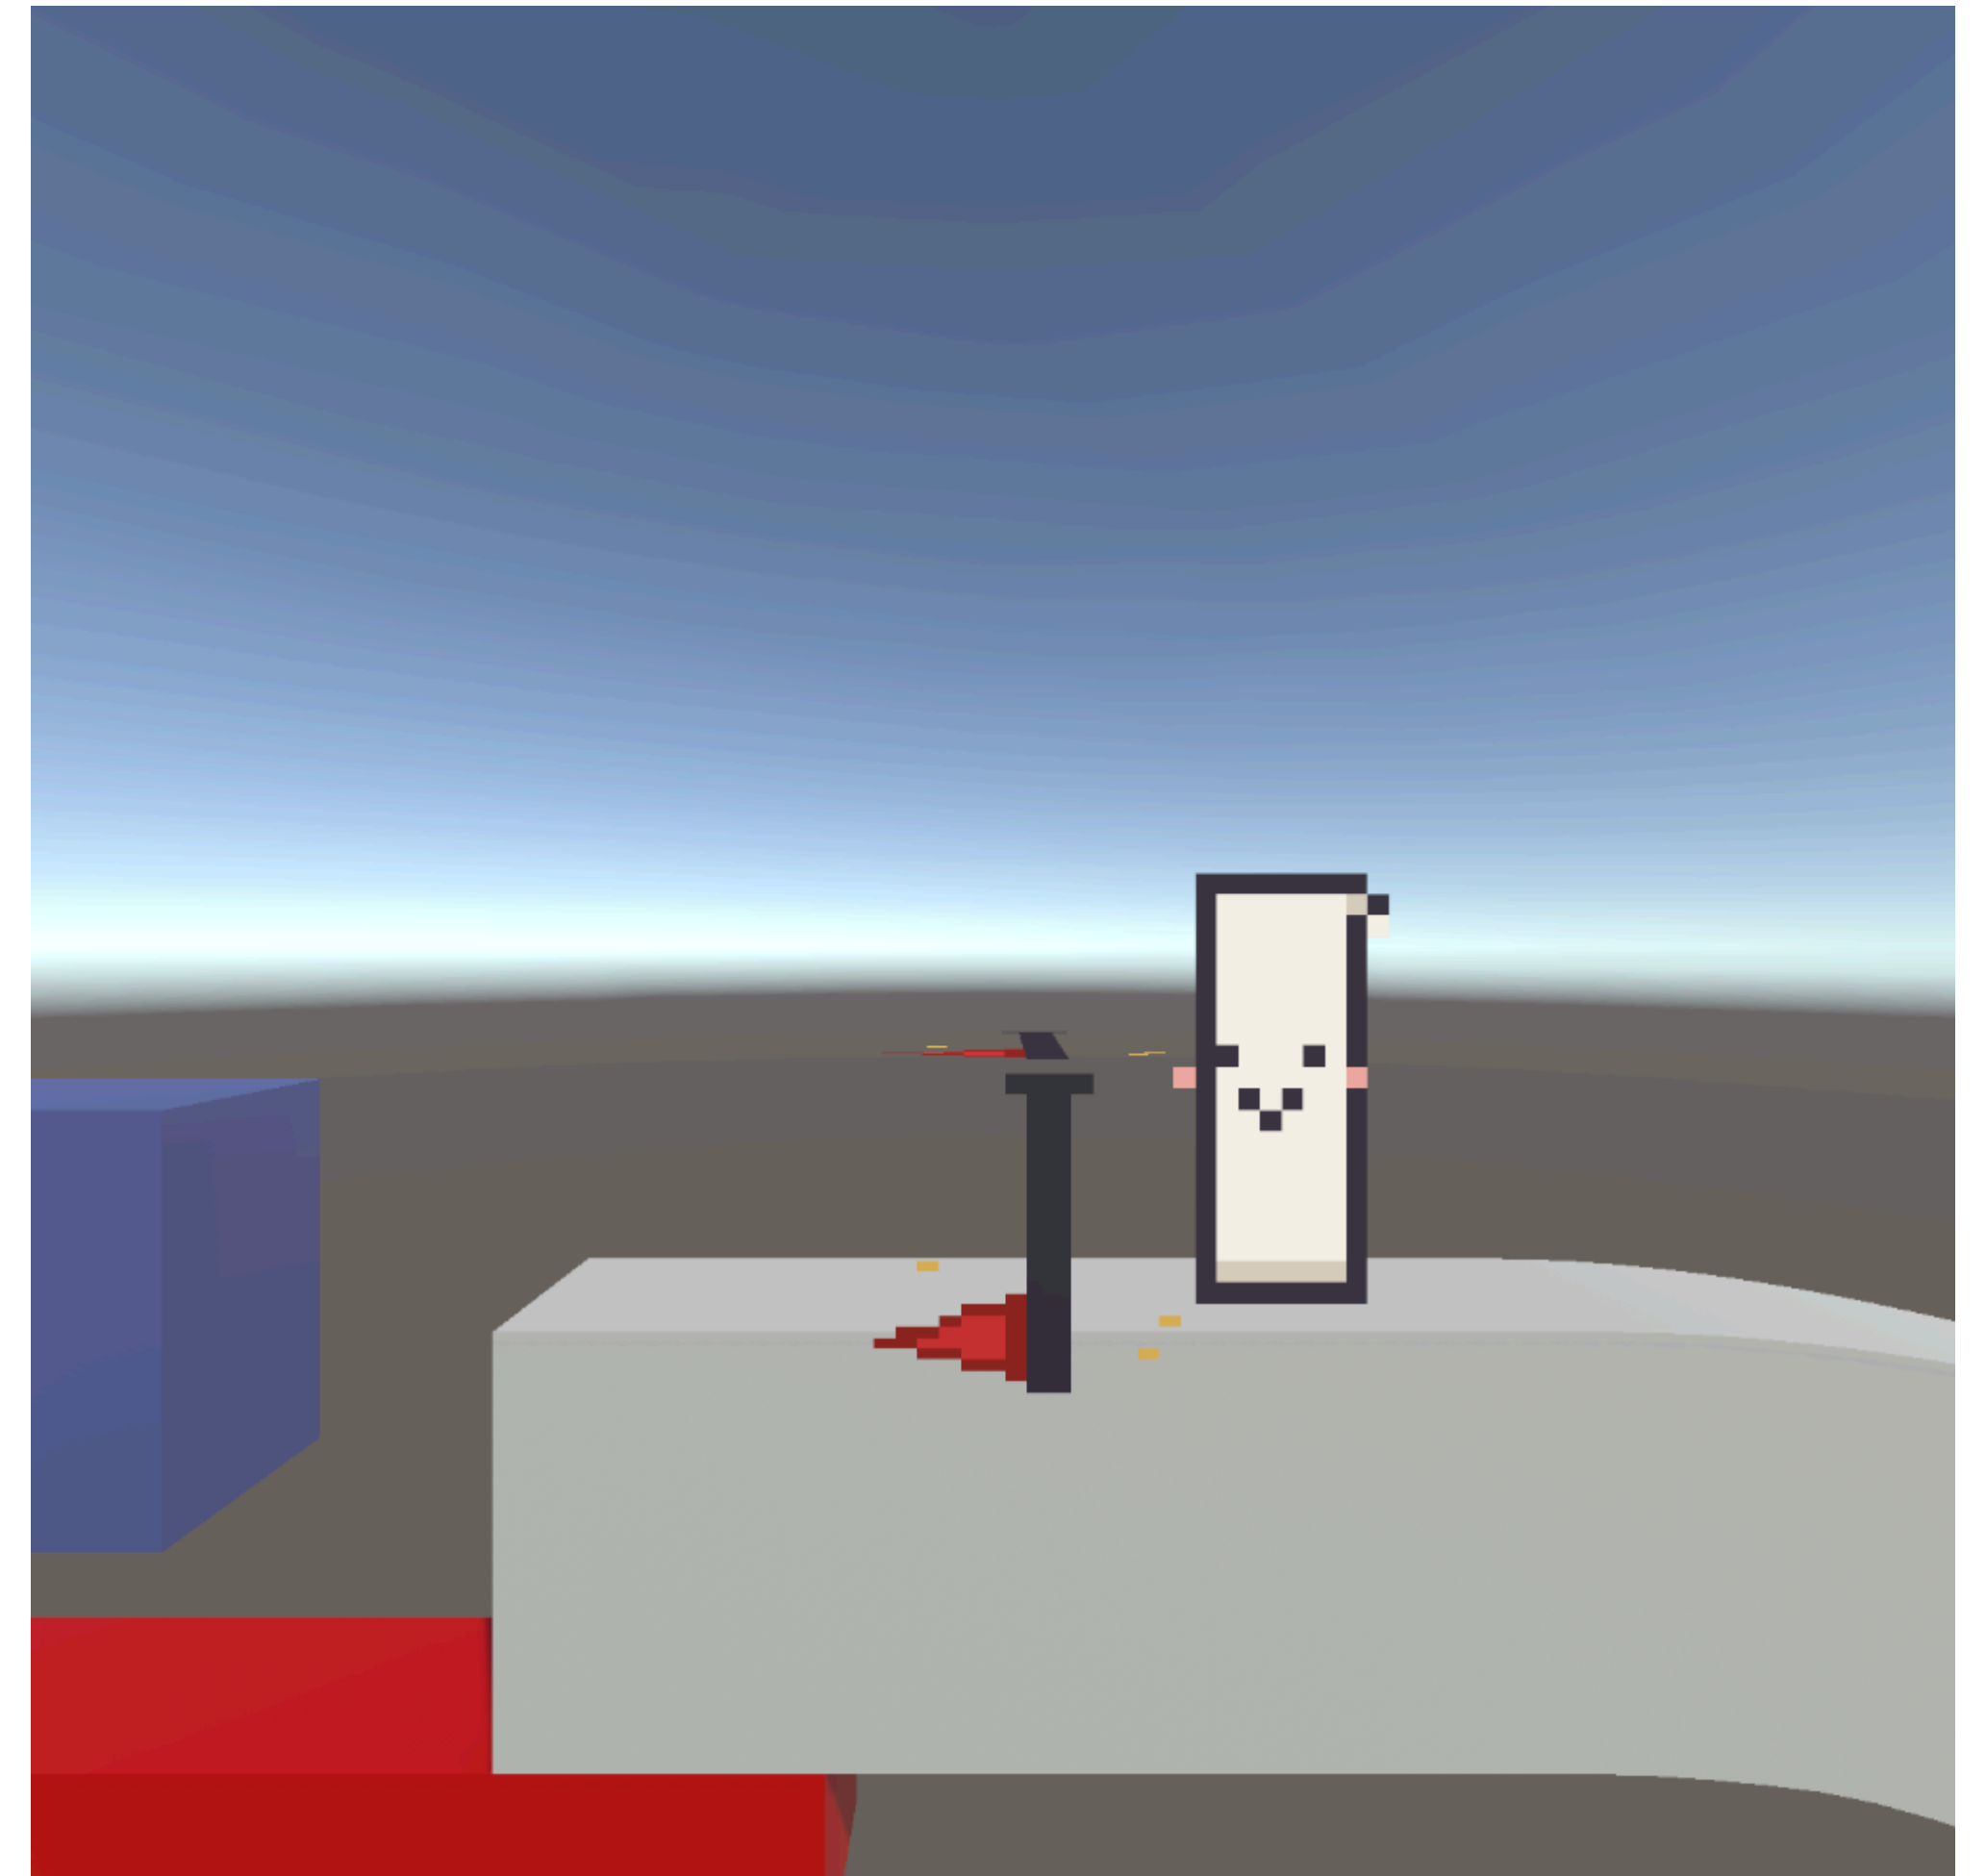

So what's the end goal?

The paper didn't know.

He was discarded as they saw no value in him. But he never stopped moving even though he didn't know his purpose. In the end, he realised that he was driven by his desires and not his destiny. He can be or do whatever he wants!

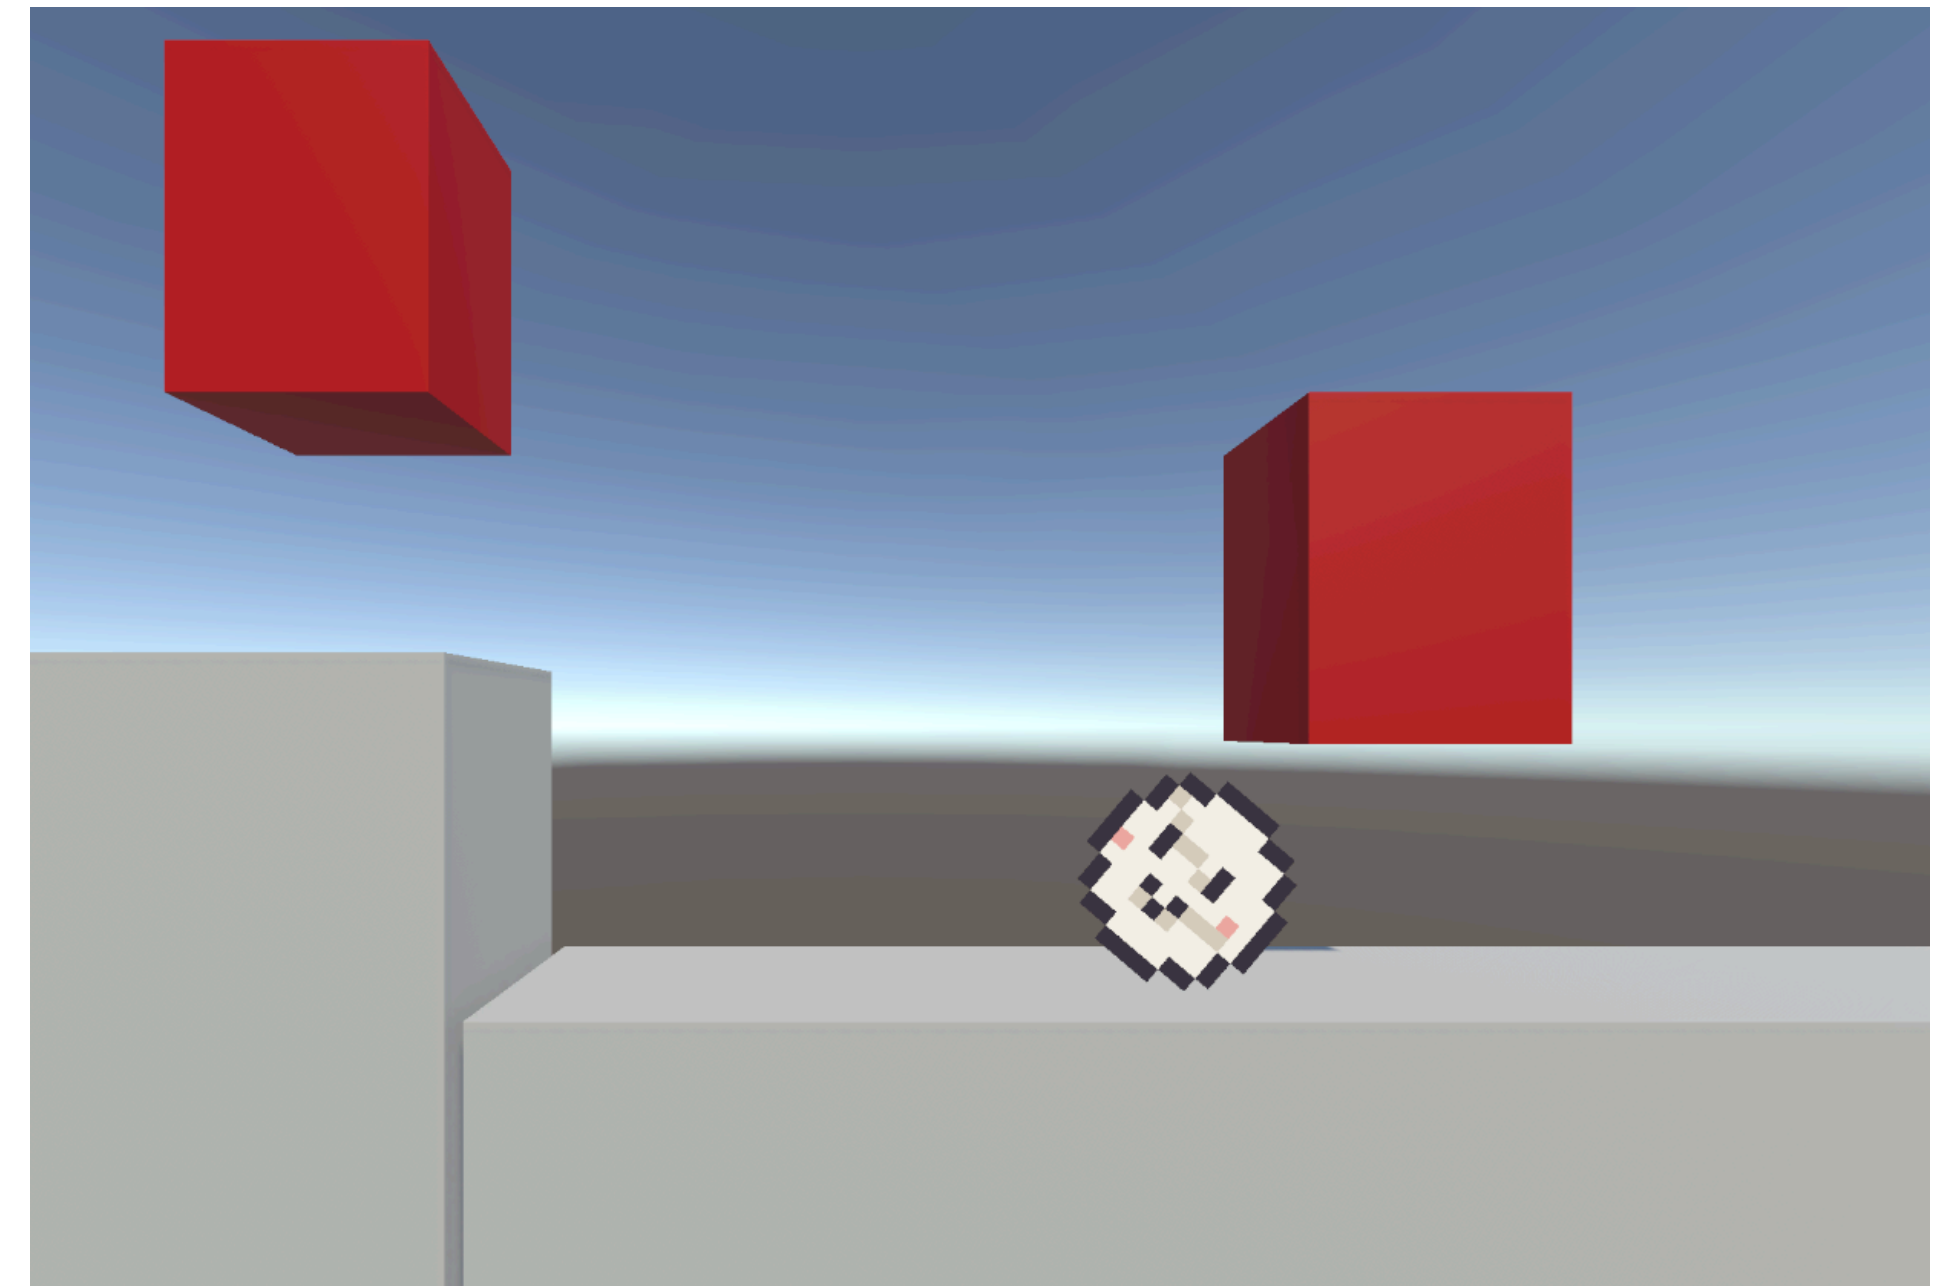

Introduction

- The target audience of this game is people who enjoy platformers.
- The aim of the game is to be a metaphor for people as they get their value from being adaptable in the face of challenges just as the paper did.
- The features of the game are platforming mechanics, mainly the transformations.
- This would be fun as it poses a challenges to players as it ramps in difficulty

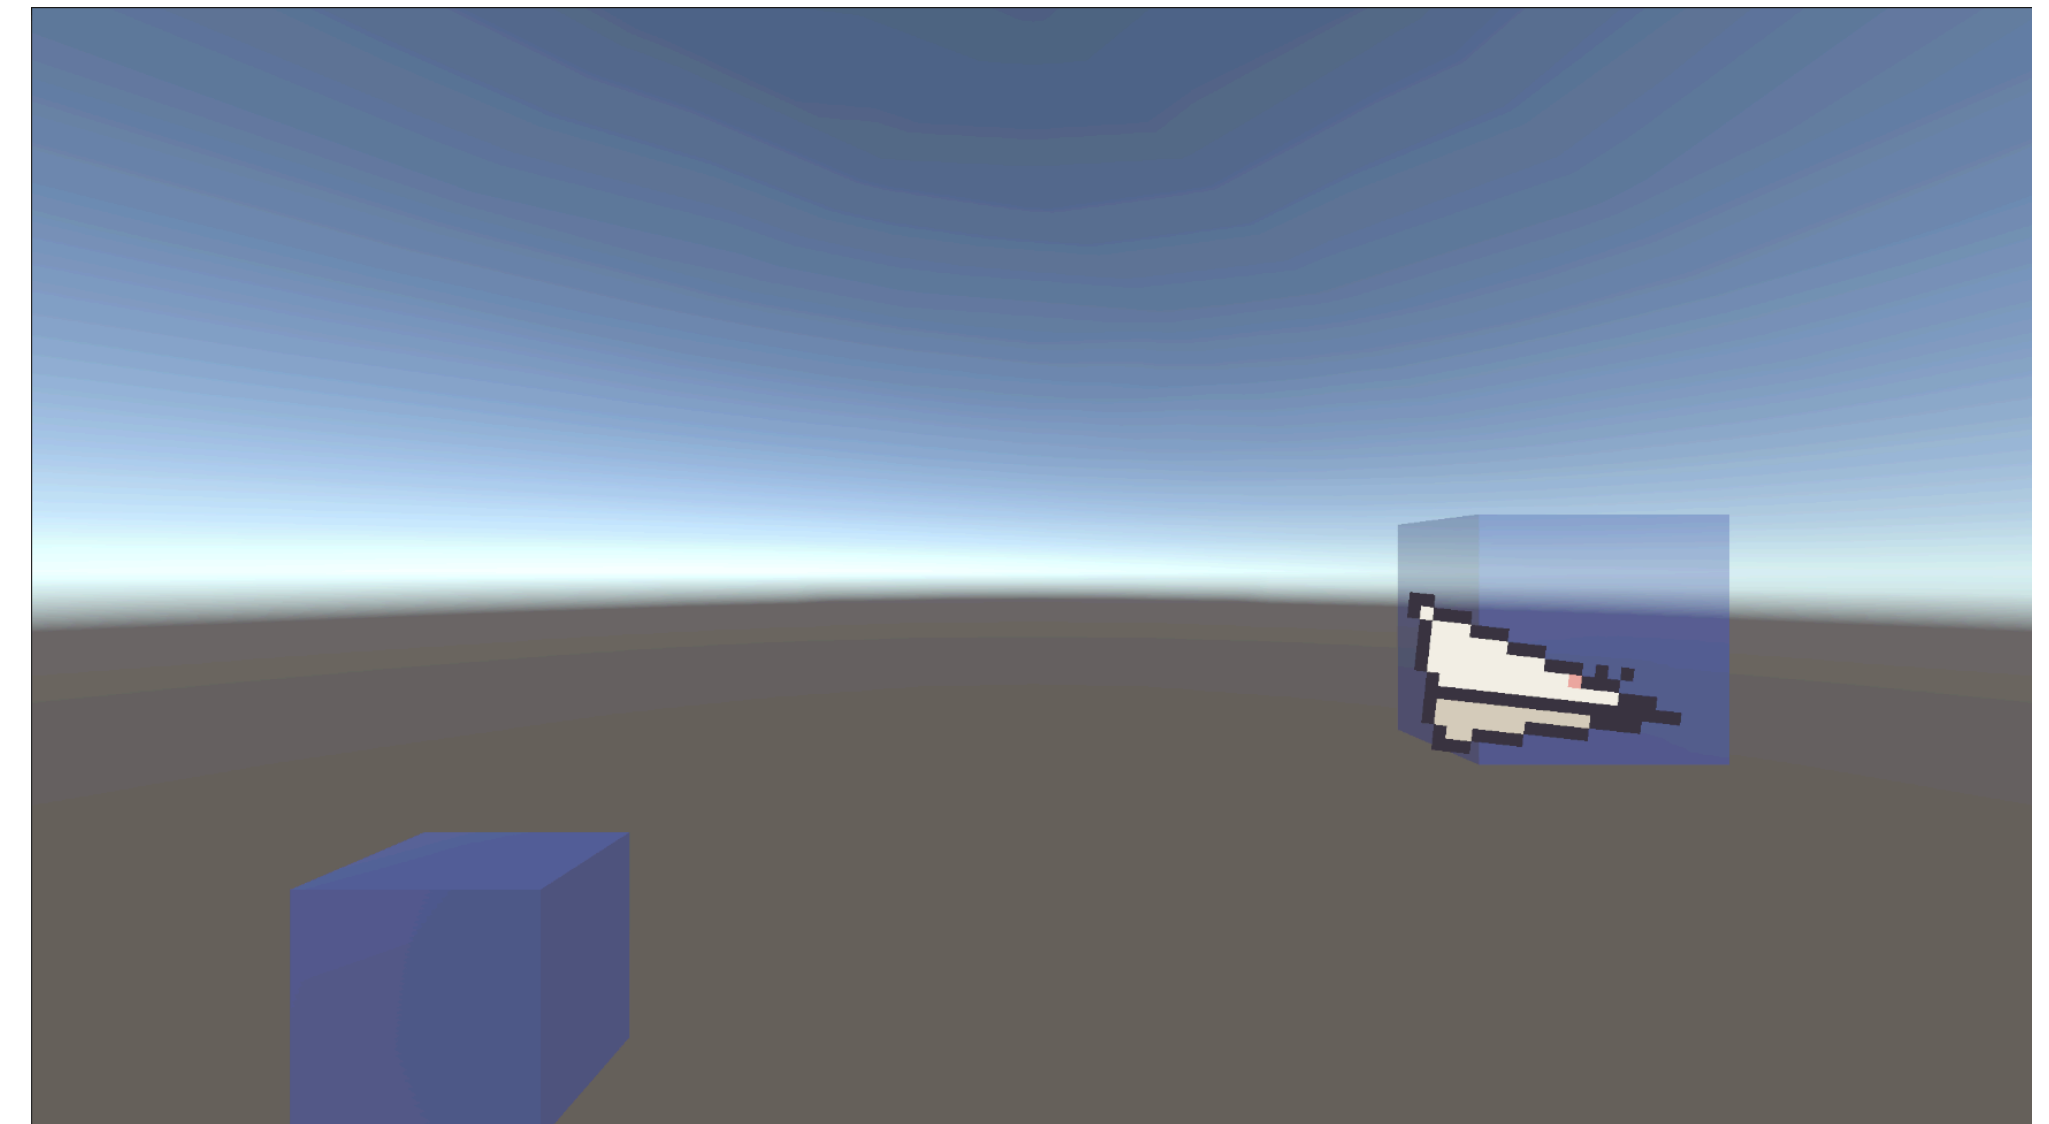

Design Choices

- The user has to persevere through the game as the difficulty increases dramatically when they progress. They keep their hands on the space and WASD keys.
- We went for a light colour and the platforms are the default blender materials to show the simplicity of the game.

Technical Implementation

- The code was done with C#, and it was used to determine the behaviour of different transformations.
- The code works for the transformations by setting different behaviours and colliders for each shape. This means the size, the shape, the force of their movement and the gravity factor of which they are affected.

LIVE DEMO!!

please dont break

Future Developments

- Add different worlds
- Improved visual
- Handling improvements
- Intro/outro

btw there actually isnt a goal

this is a reflection of our human tendancy to do things that dont actually have meanings
if paper can turn into so much and do so many things
what do you think you could do?

Thanks for Listening!!
