1

A brief summary of the
game

2

Our problems

3

How we overcame our
problems

4

What could be improved

5

Bonus

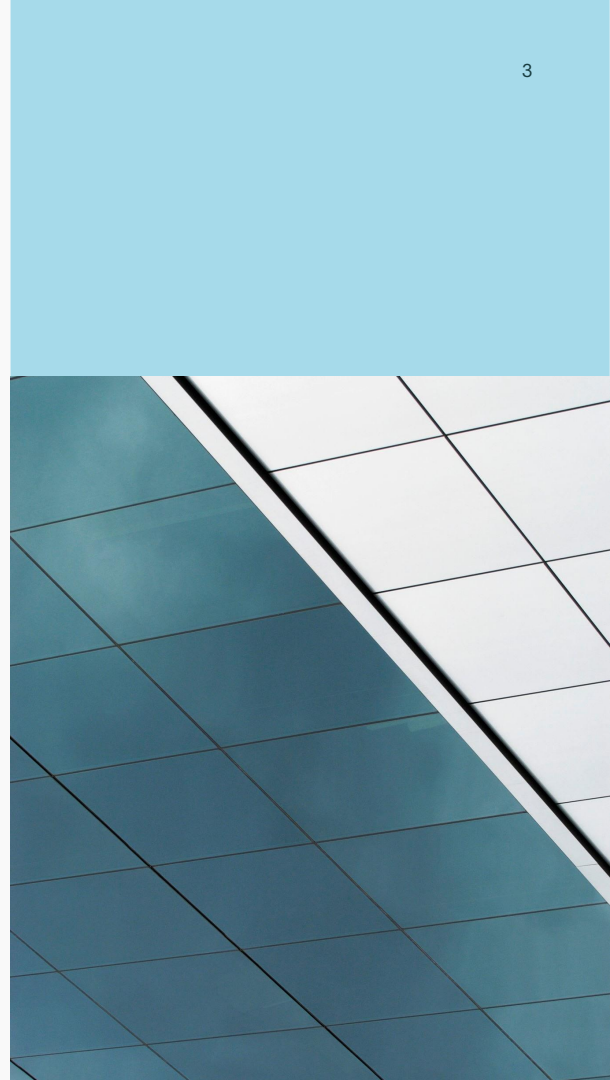

6

Thank you

About our game:

Our game is about a cup travelling across office spaces to find and delete a classified file on the CEO's desk, little did he know that he might never make it out alive. Currently, there are 7 levels in game, with each level consisting of a boss. To proceed, you must sneak out without the boss noticing, however they are not your only enemy...

How we came up with our game: Since many people drink a cup of milo everyday, we decided to choose a cup of milo as our main character.

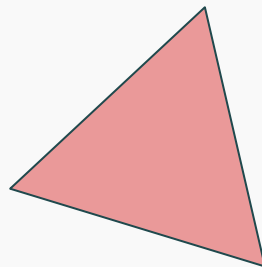

OUR PROBLEMS:

We faced many problems while designing our game. Our main problem was due to time constraints since we only had technically 2 days to design our game and barely enough time to model something. We had also never met one another before and were working with strangers. Most of us had just been introduced to C#, and were still in the process of learning how to code properly. There were also times when we had to implement things we haven't learned like animating in blender and coding time limits.

How we overcome our problems

Despite time constraints, we were able to model a few levels, and changed the door to a green flag. A time limit was also added to stress the player out more. The jump buttons have added buffs (ahem, totally intentional), and the model is a simple capsule. We also managed to make a menu, though it definitely needs improving. We also got to know each other so one of our problems were solved. Although there were quite a few problems we could not overcome, most of them were solvable.

What could be improved?

1

Added a health stats system to create more pressure

2

Made more detailed models

3

Add music to our game

4

Fixed the bugs in our game

5

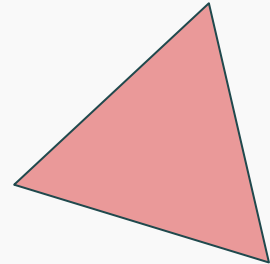

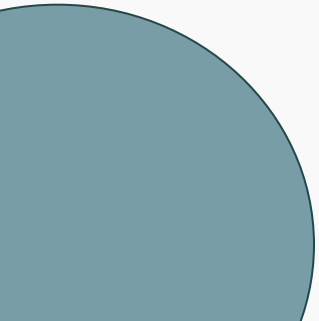

Used the models that we created, such as potted plants and paperwork

6

Stop the player from getting stuck on the ceiling

Bonus:

On the bright side, we have several models of office paperwork that has not been used, awesome music, models of potted plants, and a working cup model. All this could have been implemented if we had more time.

Thank you
