

CYBERBOUND

U15

CYBERSECURITY RPG

JACLYN AND RIYAZ

TARGET AUDIENCE

Target Audience

- Beginners in programming
- Students learning cybersecurity concepts
- Casual players interested in puzzle/adventure games

WHY THIS IS FUN / USEFUL

The game turns learning into exploration. Instead of reading theory, players actively solve problems inside a dungeon world, making cybersecurity concepts more engaging and interactive.

GAME CONCEPT

Cyberbound is a 2D dungeon RPG where players solve cybersecurity-based challenges. Cyberbound is an educational dungeon RPG that teaches cybersecurity concepts through exploration, puzzles, and combat challenges. Players recover Cyber Cores from different cybersecurity domains while uncovering the mystery behind a constantly evolving digital dungeon. Challenges to progress through a corrupted digital world and restore the system core.

INTRO

Players awaken inside a corrupted digital dungeon. The world is unstable, and each area represents a different cybersecurity domain such as Python basics and reverse engineering. NPCs guide the player through challenges.

AIM OF THE GAME

The goal is to explore the dungeon, complete NPC challenges, collect Access Keys, and restore the corrupted Core Chamber.

LIVE DEMONSTRATION

CHALLENGES FACED

A major challenge was that several scripts broke near the end of development, especially movement, interaction, and dialogue systems. This was caused by time pressure and trying to fix multiple systems quickly, which introduced more bugs.

SOLUTIONS

The project was simplified into a stable core loop:

- Move
- Interact
- Solve challenges
- This allowed the game to remain functional and meet the core requirements.

FUTURE DEVELOPMENTS

- More cybersecurity domains (networking, pwn, cryptography)
- Combat system with cyber enemies
- Inventory system for keys and tools
- More complex puzzle mechanics
- Expanded dungeon progression system

FUTURE DEVELOPMENTS

- Level 1 restrictions:
- Python basics
- Theme: Write / understand code, adventure (diff domains eg offensive defensive, diff areas of cybersec. That way each dungeon feels like a different cybersecurity profession instead of the same quiz with different questions.)
- General Cyber Awareness (Spot the phishing email, Choose a strong password, Identify suspicious links, Safe vs unsafe behavior), Cryptography Basic (Caesar cipher, Decode a secret message, Match encrypted text)
- Theme: decode information, problem solving
- Level 2 restrictions:
- Reverse Engineering (Find a hidden password in a program, Read clues from strings, Understand simple logic)
- Theme: investigate code, critical thinking
- Web Security (find an SQL injection, understand login flaws, spot insecure forms)
- Level 3 restrictions:
- Digital Forensics
- Networking
- Binary Exploitation (Pwn)
- Theme: exploit systems, offensive

THANK YOU
