

June Jam 2026

U7!

The problem statement

Create a game that challenges players to see an everyday routine or object in a completely new way. Find the magic, humour, or challenges hidden in the mundane!

The interpretation?

When thinking of 'everyday routines' I thought, of what defined an everyday routine and came up to a conclusion that it simply didn't exist. Each and every person has their own unique routine that they followed.

From people who wake up every morning to go on a jog to others who just scroll on their phone to catch up with news, an everyday routine was basically anything!

And this affects us how?

So, instead of showing one perspective... let's show many!

Bad naming conventions? Always has been.

So we introduce you to...

Day2Day!

**A point and click game to get ready and to
experience the lives of many!**

A joke on the words

Day to Day (as in routines)

and Day today!

Okay? But who wants this?

Our target audience is the **casual gamer**.

With easy to understand and needing to click on items with their mouse, this simplistically designed game was thought of to be played by just about anyone

What's the Day2Day? (pun)

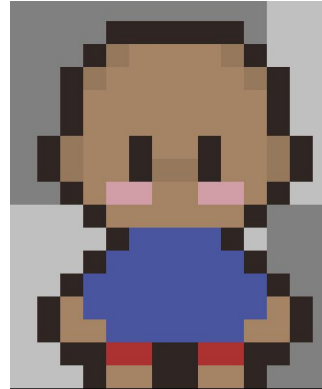

Today is 12/6/2026

Ok, what actually is Day2Day

Day2Day is a game where you get to play as different characters with their own unique circumstances! Each with different needs and challenges!

The player would pick their desired character and help them get ready for the day in the morning!

Meet John Singapore (I am bad at naming):

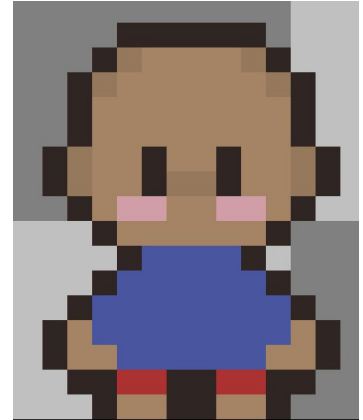

John Singapore's level 1 (Primary School)

John is an average guy with an average family and average... everything. The first level is him getting ready for

PRIMARY SCHOOL

With a simple task list of:
Change into uniform (required)
Pack bag (required)
Eat breakfast
Shower

Progress

As you pass the stage, John will age up for level 2 where he is now in Poly and now had different tasks (and also adopted a dog and taken gardening as a hobby)

New task list:

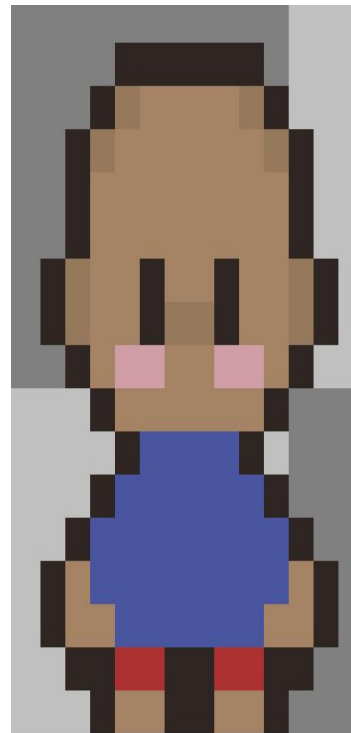

Pick outfit to wear (required)

Feed the plants (required)

Water the dog (required)

Eat breakfast

Doomscroll

Stats!

Doing a task (Pointing and Clicking on the respective item) would make John go to the item and use it for some time, upon completing will gain him a value to one of these 3 stats:

Hunger

Hygiene

Energy/Motivation

The player is required to meet the minimum requirements (which change depending on the level and character) for all 3 stats to move onto the next level, failure will result in a game over xd

Other characters

There could have been other characters planned who have their own benefits and challenges:

Jane Singapore who packs everything she needs beforehand! (Less tasks that needed to be done)

Marri Marrison who has kids but is a housewife (Much more tasks to do but has extra time due to her waking up early)

But how is any of this fun?

The game's appeal is it's simple gameplay loop but the main part of the fun is seeing the different character perspectives and see them grow between levels.

Wow! This sounds good! How did you make it!

Simple!

I ran out of time and barely got any of the actual game done :D

Prepare to be disappointed as I load up the barely made game :D

That was... underwhelming.

It was, but now with that over, I will go over what was actually planned but never implemented due to time constraints.

The movement

The original plan was to have the player click an item as the character would use the A Star algorithm to pathfind their way to the item's location via hidden nodes placed around the level layout.

Then time constraints happened and had to scrap the idea in favor of a more simple teleport which would take less time to implement (Which also couldn't be implemented due to time restraints T_T)

What about the items?

The items would be once interacted with could have 2 types actions.

1. The instants

Instants are done very quickly, once the animation played out, you gain points and can move to your next task.

2. The timed

Actions that once interacted with would start a countdown, interact with it again when it is done to gain the stats. Used for some characters for challenges such as a character having problems keeping track of time making the timer disappear when the character is far enough from the item.

Why pixel art?

Because it's cute and charming. Many small games such as the games from a company called Kairossoft use pixel art compared to 3D graphics.

Point and Click games (such as this one) also tend to use pixel art! (Examples include: Pajama Sam, Putt Putt, Sam and Max and so much more!)

Other features thought of but not implemented due to extreme complexity and time needed for them to be implemented (Potential future developments)

Consequences of habits: A system that punished or rewarded players who did or did not do certain optional tasks. (e.g. John not eating breakfast in level 1 would make him develop malnutrition and will move slower on level 2)

Aesthetics to fit character: Have the style of the games change to match characters (e.g. John at level 1 will have the existing cute pixel art to match his childlike wonder but John at level 3 where is an adult will either be in 3D to show how he has become a realist or the pixel art would have a darkened color palette. (Gameplay remains the same))
